# The hyphsubst package

## Heiko Oberdiek\*

## 2016/05/16 v0.3

#### Abstract

A TEX format file may include alternative hyphenation patterns for a language with a different name. If the naming convention follows babel's rules, then the hyphenation patterns for a language can be replaced by the alternative hyphenation patterns, provided in the format file.

## 1 Documentation

### 1.1 In short

The package is an experimental package that allows the substitution of hyphenation patterns, example:

<sup>\*</sup>Please report any issues at https://github.com/ho-tex/oberdiek/issues

```
\RequirePackage[ngerman=ngerman-x-20080601]{hyphsubst}
\documentclass{article}
\usepackage[ngerman]{babel}
```

The patterns ngerman are replaced by the patterns ngerman-x-20080601. The format must contain these patterns and should use the naming scheme of either babel's language.dat or etex.src's language.def.

#### 1.2 Longer version

Assume the format may contain the following hyphenation patterns (excerpt from language.dat):

```
ngerman dehyphn.tex
ngerman-x-20071231 dehyphn-x-20071231
ngerman-x-20080601 dehyphn-x-20080601
=ngerman-x-latest % alias for ngerman-x-20080601
```

The patterns that contain -x- are experimental new patterns for ngerman. However, package babel does not provide the use of patterns that do not have the same name as the used language (dialect). The babel system remembers patterns in macros:  $\ensuremath{\mbox{l@(}name)}$ .  $\ensuremath{\varepsilon-\mbox{TE}}X$ 's etex.src uses  $\ensuremath{\mbox{lang@(}name)}$  instead. In the following we use babel's naming scheme, but etex.src's naming scheme is supported, too.

This package hyphsubst solves the problem by redefining the macro  $\10(name)$  to use other patterns.

## \HyphSubstLet $\{\langle nameA \rangle\}$ $\{\langle nameB \rangle\}$

 $\label{eq:local_nameA} \now has the same meaning as <math>\alpha(nameB)$ . The patterns for nameB must exist. If the patterns for nameA exist, then they will be overwritten to use the patterns for nameB. Example:

```
\documentclass{article}
\usepackage{hyphsubst}
\HyphSubstLet{ngerman}{ngerman-x-20080601}
\usepackage[ngerman]{babel}
```

Now the patterns ngerman-x-20080601 are be used.

Or if you want to compare hyphenations:

```
\documentclass{article}
\usepackage{hyphsubst}
  % save original patterns for ngerman in ngerman-saved
\HyphSubstLet{ngerman-saved}{ngerman}
\usepackage[ngerman]{babel}
\begin{document}
  We start with the original patterns for ngerman.
  \HyphSubstLet{ngerman}{ngerman-x-latest}%
  Now we are using ngerman-x-latest.
  \HyphSubstLet{ngerman}{ngerman-saved}%
  Again we are using the original patterns.
\end{document}
```

```
\HyphSubstIfExists \{\langle name \rangle\}\ \{\langle then \rangle\}\ \{\langle else \rangle\}
```

Tests if patterns with name  $\langle name \rangle$  exist and execute  $\langle then \rangle$  in case of success and  $\langle else \rangle$  otherwise.

### 1.3 LATEX

The package can also be loaded before \documentclass:

```
\RequirePackage[ngerman=ngerman-x-20080601]{hyphsubst}
\documentclass{article}
...
```

This allows to put the package in a format file.

Package options are interpreted as 'let' assignments and passed to macro \HyphSubstLet:

```
\usepackage[ngerman=ngerman-x-20080601]{hyphsubst}
```

The part before the equal sign is the first argument for \HyphSubstLet and the part after the equal sign forms the second argument:

```
\HyphSubstLet{ngerman}{ngerman-x-20080601}
```

Note, this only works for direct package options. Global options are ignored.

## 1.4 plain T<sub>E</sub>X

The package can be loaded and used with plain TFX, e.g.:

```
\input hyphsubst.sty
\HyphSubstLet{ngerman}{ngerman-x-latest}
```

## 2 Implementation

```
1 (*package)
```

#### 2.1 Reload check and package identification

Reload check, especially if the package is not used with LATEX.

### 3 Installation

#### 3.1 Download

**Package.** This package is available on CTAN<sup>1</sup>:

CTAN:macros/latex/contrib/oberdiek/hyphsubst.dtx The source file.

CTAN:macros/latex/contrib/oberdiek/hyphsubst.pdf Documentation.

**Bundle.** All the packages of the bundle 'oberdiek' are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

CTAN: install/macros/latex/contrib/oberdiek.tds.zip

TDS refers to the standard "A Directory Structure for TEX Files" (CTAN:pkg/tds). Directories with texmf in their name are usually organized this way.

#### 3.2 Bundle installation

Unpacking. Unpack the oberdiek.tds.zip in the TDS tree (also known as texmf tree) of your choice. Example (linux):

```
unzip oberdiek.tds.zip -d ~/texmf
```

### 3.3 Package installation

**Unpacking.** The .dtx file is a self-extracting docstrip archive. The files are extracted by running the .dtx through plain  $T_EX$ :

```
tex hyphsubst.dtx
```

**TDS.** Now the different files must be moved into the different directories in your installation TDS tree (also known as texmf tree):

```
\label{eq:hyphsubst.sty} $$ \  \  \, \to tex/generic/oberdiek/hyphsubst.sty $$ \  \  \, \to doc/latex/oberdiek/hyphsubst.pdf $$ \  \  \, \to source/latex/oberdiek/hyphsubst.dtx $$ \  \  \, \to s
```

If you have a docstrip.cfg that configures and enables docstrip's TDS installing feature, then some files can already be in the right place, see the documentation of docstrip.

<sup>1</sup>CTAN:pkg/hyphsubst

#### 3.4 Refresh file name databases

If your T<sub>E</sub>X distribution (T<sub>E</sub>X Live, MiKT<sub>E</sub>X, ...) relies on file name databases, you must refresh these. For example, T<sub>E</sub>X Live users run texhash or mktexlsr.

#### 3.5 Some details for the interested

Unpacking with LaTeX. The .dtx chooses its action depending on the format:

plain T<sub>E</sub>X: Run docstrip and extract the files.

LATEX: Generate the documentation.

If you insist on using LATEX for docstrip (really, docstrip does not need LATEX), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{hyphsubst.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

Generating the documentation. You can use both the .dtx or the .drv to generate the documentation. The process can be configured by the configuration file ltxdoc.cfg. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with pdfIAT<sub>F</sub>X:

```
pdflatex hyphsubst.dtx
makeindex -s gind.ist hyphsubst.idx
pdflatex hyphsubst.dtx
makeindex -s gind.ist hyphsubst.idx
pdflatex hyphsubst.dtx
```

## 4 History

## [2008/06/07 v0.1]

• First public version.

```
[2008/06/09 v0.2]
```

- Support for  $\varepsilon$ -T<sub>E</sub>X's language.def added.
- Fix for undefined \lmsg.

## [2016/05/16 v0.3]

• Documentation updates.

### 5 Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; plain numbers refer to the code lines where the entry is used.
